

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

VI. *A Remark upon the New Opinion relating to the Forces of moving Bodies, in the case of the Collifion of Non-Elastic Bodies.* By Mr. John Eames, F. R. S.

1. **T**HE antient Opinion, and moſt generally entertained, is, that the Forces of Bodies in Motion are as their Quantities of Motion, *i. e.* as their Quantities of Matter multiplied by their reſpective Celerities.

2. The new Opinion is, that the Forces of Bodies in Motion are as their Quantities of Matter multiplied by the Squares of the Velocities; ſo that in equal Maſſes the moving Forces will not be as the Velocities themſelves, but as their Squares.

3. Hence it follows, that a Body moving with five Degrees of Velocity, moves with five and twenty Times more Force, than when it moves but with one Degree; whereas according to the common Opinion, it has but five times as much, *i. e.* proportional to its Velocity.

4. The lateſt Experiments brought to prove the truth of the new Opinion are made upon ſoft, or yielding Subſtances. Now theſe have been already obſerved to be a little complicated, and improper for this Purpoſe. The proper Uſe of Experiments of this kind being rather to diſcover, and ſettle the Laws, which ſuch kind of Subſtances obſerve in the Reſiſtance they make to Bodies moving in them, than the Forces themſelves, with which the Bodies move, which ought to be determined before hand by ſome ſimple Experiment, fit to determine that Matter.

5. A variety of Experiments have been made, and reasoning used in *England* and *France*, to prove the Truth of the common Opinion; but they do not entirely satisfy all the Gentlemen on the other side of the Question. The present ingenious Professor of Mathematicks and Philosophy at *Utrecht* tells us in the Preface to his *Epitome Elementorum Physico-Mathematicorum*, publish'd this Year, Anno 1726, *In corporum motorum viribus supputandis amplexus sum sententiam Cl. Leibnitii, Hugenii, Poleni, S. Gravesandii, & antiquæ valedixi, quam hæcenus foveram, & docueram: Neque me retinuerunt argumenta doctissimorum virorum in Galliis & Britannia eandem defendentium.*

Et quando experimenta à Poleno & S Gravesandio descripta examinantur & inspiciuntur, tam manifesto evincunt vires corporum percutientium esse in ratione composita ex quadrata velocitatum, & simplici massarum, ut illis subscribere teneamur, nisi apertissimis contradicere studeamus.

6. I beg leave to examine the truth of the new Opinion in the Case here proposed, *viz. Vires corporum percutientium*; and I shall endeavour to shew from their own Principles, that it cannot be true in all the Cases of Non Elastic Bodies.

7. 'Tis allow'd, that the common Rules of finding the Velocities of Non-Elastic Bodies after the Stroke are true: For thus the ingenious Mr. S. Gravesand tells us in Paragraph 251, of his *Supplementum Physicum*; *Ex hoc principio (i.e. multiplicando massam per velocitatem) deduxêre Philosophi ipsas illas regulas n. 234. s. 237. s. quas nos variis modis ex principiis nostris deduximus; mirum hîc quid contigit, error erroris fuit destructio, & duplex error ad veritatem conduxit; falsum de mensura virium secuti sunt principium, & quod veritati etiam minimè congruum est, nullam vim intro premendo partes*

partes, & harum superando cohæsionem corpora amittere possuere.

8. Now the Rule for finding the common Velocity of Non-Elastic Bodies moving the same way after the Collision, is, to divide the Sum of the Quantities of Motion in the two Bodies, by the Sum of the Quantity of Matter.

9. 'Tis also granted, *Motu duobus corporibus communi corpora hæc in se mutuo agere non posse.* In Sect. 215. Supplement. Phys.

10. *Pendet ergo ictus à velocitate respectiva, qua manente intensitas impacttionis eadem erit, quomodocunque celeritates absolutæ variant.*

11. *Ab intensitate hac pendet partium introcessio, quæ ergo semper eadem erit, si duo corpora eadem velocitate respectiva in se mutuo incurrunt, quibuscunque velocitatibus moveantur.*

12. These Principles furnish us with an Argument against the new Opinion. For if it be true, then equal Causes may have unequal Effects, and that in their own sense of an Effect: The Proof shall be taken from Instances of the Effects of the Collision of Non-Elastic Bodies, whose respective Velocities shall be always equal.

13. Let (A) and (B) stand for two Non-Elastic Bodies of equal Quantities of Matter; and let (B) be at rest, while (A) moves towards it with 8 degrees of Velocity.

1. Here the common Velocity after the Stroke will be half the Velocity of (A) before the Stroke, *i. e.* 4 degrees. Consequently the force in (B) thus communicated by the Stroke will be as its Square, or 16.

2. Let (B) move forward with two degrees of Velocity, and (A) follow it with 10 degrees; the respective Velocity will be 8 as before; consequently by Paragraph 10th of this Paper, the Strokes in both cases are equal. The Velocity in (B) after the Stroke will be half the Sum of the Velocities before the Stroke, or 6 degrees, by Paragraph 8th.

According to the new Opinion, the Forces being as the Squares of the Velocities, the Force of (B) before the Stroke will be to its Force after the Stroke, as the Square of 2 is to the Square of 6; *i. e.* as 4 is to 36. Subtract the Force in (B) before the Stroke, from the Force it has after the Stroke, and you have the Degrees of Force communicated by the Stroke: Which, if this Opinion were true, would be 32, *i. e.* just double the Number of Degrees communicated by the same Force in the former Instance, which was but as 16. Thus equal Strokes produce unequal Effects in our sense of Effects.

14. The following Table gives several other Instances. In the three first Columns you have the Velocities of the two Bodies both before, and after the Stroke; in the two next, you have the Forces in (B) both before, and after the Stroke; and in the sixth, the Difference of those Forces, or the different Degrees of Force effected by the same Stroke; and in the last Column, the Proportion of those Forces, or Effects of the Cause or Stroke.

The Velocity in			The Forces in B.		Force communicated by the Stroke.	Proportion.
A	B	B				
8	0	4	0	16	16	1
10	2	6	4	36	32	2
14	6	10	36	100	64	4
18	10	14	100	196	96	6
22	14	18	196	324	128	8
26	18	22	324	484	160	10
Before After			Before After			
the Stroke.			the Stroke			

15. If it be said, that I have not consider'd the other part of the entire Effect of the Stroke, the Intropression of the Parts ; I reply, this will make but a small Alteration in the matter ; since the Intropressions in all these Cases are equal, (Paragr 11.) the relative Velocities being by supposition the same : So that notwithstanding upon the whole, one and the same, or equal Causes, will produce unequal Effects.
